

# SELLING TIPS & FAQs

## Stump Grinder

**FEATURE:** **Piston Motor**

- REASON:**
- 1) The piston motor is a much more efficient (97% versus 70%) and a much stronger motor (torque remains consistent through RPM range) than the gerolar types used by competitors brands. It does require a case drain line
  - 2) A piston motor runs much cooler than other motor types, which is important on attachments that run for long periods of time

**FEATURE:** **Perpendicular Position of the Cutting Wheel**

- REASON:**
- 1) Eliminates the need for a swing function, which robs critical flow from the wheel and also requires electrical
  - 2) Can be moved from one machine to another very easily due to the fact it does not require electricity

**FEATURE:** **Bi-directional Cutting**

- REASON:**
- 1) Increase production by cutting in both directions. At the time of this publication, no other stump grinder had the ability to cut in both directions with this particular style grinder

**FEATURE:** **4 Point Pivot Linkage**

- REASON:**
- 1) This linkage allows the stump grinder to move back and forth independent of the mounting when pushed beyond what it can keep up with. Although some others can swing in one direction, none of them remain perpendicular to the cut like ours does

**FEATURE:** **Green Teeth**

- REASON:**
- 1) This well-known tooth design has a huge following in the industry, and have been requested for years. It is a very aggressive tooth that increases production

**FAQ's:**

**Q: *How fast can I grind a stump?***

**A:** This is almost an impossible question to answer due to flow ranges and wood differences. However we feel we can confidently say that when it comes to skid steer stump grinding... you will not find one that will out perform this one (unless it has its own power source independent of the host machine).

**Q: *What flow do I need?***

**A:** We have models for machines from 16 GPM up, but in the lower GPM range expectations need to be realistic. We have tested this one to 13 GPM with good results.

## SELLING TIPS & FAQs

### **Stump Grinder** (continued)

**Q: How do these compare to a dedicated stump grinder machine?**

**A:** A dedicated unit obviously has some advantages but they are expensive and it usually means sending two crews to the job site. If your skid steer is already on site moving logs and brush... then why not just grind the stump too?

**Q: How deep will it grind?**

**A:** It is 8" to where the motor will contact the ground, however by grinding a slightly bigger hole you are able to go down as deep as your skid steer will allow you.
